

ABSTRACT

Management terminal apparatus, wireless terminal apparatus, and a wireless communication method that
5 reduces interference and improves communication quality under a communication environment where a plurality of wireless communication schemes are mixed. At management terminal apparatus (200), a wireless section (210) receives communication profile information from wireless
10 terminal apparatus (100) and outputs this to communication permission generating section (220). The communication profile information may include information for a used wireless communication scheme, used frequency bandwidth, communication start time and
15 communication continuation time, for wireless resources shared by a plurality of wireless communication schemes within the wireless communication system. Furthermore, wireless section (210) transmits communication permit/deny information to wireless terminal apparatus
20 (100). Communication permission generating section (220) refers to communication profile information and communication permission history stored in storage section (230) and generates communication permit/deny information for communication of communication profile
25 information. Storage section (230) stores communication permit/deny information as communication permission history.
